

threading

importing required libraries and programming our board

```
In [1]: import threading
import time
from pynq.overlays.base import BaseOverlay
base = BaseOverlay("base.bit")
```

Two threads, single resource

Here we will define two threads, each responsible for blinking a different LED light. Additionally, we define a single resource to be shared between them.

When thread0 has the resource, led0 will blink for a specified amount of time. Here, the total time is 50×0.02 seconds = 1 second. After 1 second, thread0 will release the resource and will proceed to wait for the resource to become available again.

The same scenario happens with thread1 and led1.

In [2]:

```

def blink(t, d, n):
    '''
    Function to blink the LEDs
    Params:
        t: number of times to blink the LED
        d: duration (in seconds) for the LED to be on/off
        n: index of the LED (0 to 3)
    '''
    for i in range(t):
        base.leds[n].toggle()
        time.sleep(d)
    base.leds[n].off()

def worker_t(_l, num):
    '''
    Worker function to try and acquire resource and blink the LED
    _l: threading lock (resource)
    num: index representing the LED and thread number.
    '''
    for i in range(4):
        using_resource = _l.acquire(True)
        print("Worker {} has the lock".format(num))
        blink(50, 0.02, num)
        _l.release()
        time.sleep(0) # yeild
    print("Worker {} is done.".format(num))

# Initialize and launch the threads
threads = []
fork = threading.Lock()
for i in range(2):
    t = threading.Thread(target=worker_t, args=(fork, i))
    threads.append(t)
    t.start()

for t in threads:
    name = t.getName()
    t.join()
    print('{} joined'.format(name))

```

```

Worker 0 has the lock
Worker 1 has the lock
Worker 0 has the lock
Worker 1 has the lock
Worker 0 has the lock
Worker 1 has the lock
Worker 0 has the lock
Worker 0 is done.Worker 1 has the lock

```

```

Thread-4 joined
Worker 1 is done.
Thread-5 joined

```

Two threads, two resource

Here we examine what happens with two threads and two resources trying to be shared between them.

The order of operations is as follows.

The thread attempts to acquire resource0. If it's successful, it blinks 50 times $\times 0.02$ seconds = 1 second, then attempts to get resource1. If the thread is successful in acquiring resource1, it releases resource0 and proceeds to blink 5 times for 0.1 second = 1 second.

```
In [ ]: def worker_t(_l0, _l1, num):
        """
        Worker function to try and acquire resource and blink the LED
        _l0: threading lock0 (resource0)
        _l1: threading lock1 (resource1)
        num: index representing the LED and thread number.
        init: which resource this thread starts with (0 or 1)
        """

        using_resource0 = False
        using_resource1 = False

        for i in range(4):
            using_resource0 = _l0.acquire(True)
            if using_resource1:
                _l1.release()
            print("Worker {} has lock0".format(num))
            blink(50, 0.02, num)

            using_resource1 = _l1.acquire(True)
            if using_resource0:
                _l0.release()
            print("Worker {} has lock1".format(num))
            blink(5, 0.1, num)

            time.sleep(0) # yeild
        print("Worker {} is done.".format(num))

# Initialize and launch the threads
threads = []
fork = threading.Lock()
fork1 = threading.Lock()
for i in range(2):
    t = threading.Thread(target=worker_t, args=(fork, fork1, i))
    threads.append(t)
    t.start()

for t in threads:
    name = t.getName()
    t.join()
    print('{} joined'.format(name))
```

```
Worker 0 has lock0
Worker 0 has lock1Worker 1 has lock0
```

You may have noticed (even before running the code) that there's a problem! What happens when thread0 has resource1 and thread1 has resource0! Each is waiting for the other to release their resource in order to continue.

This is a **deadlock**. Adjust the code above to prevent a deadlock.

Non-blocking Acquire

In the above code, when `l.acquire(True)` was used, the thread stopped executing code and waited for the resource to be acquired. This is called **blocking**: stopping the execution of code and waiting for something to happen. Another example of **blocking** is if you use `input()` in Python. This will stop the code and wait for user input.

What if we don't want to stop the code execution? We can use non-blocking version of the `acquire()` function. In the code below, `_resourceavailable` will be `True` if the thread currently has the resource and `False` if it does not.

Complete the code to and print and toggle LED when lock is not available.

In [3]:

```

def blink(t, d, n):
    for i in range(t):
        base.leds[n].toggle()
        time.sleep(d)

    base.leds[n].off()

def worker_t(_l, num):
    for i in range(10):
        resource_available = _l.acquire(False) # this is non-blocking acquire
        if resource_available:

            # write code to:
            # print message for having the key
            # blink for a while
            # release the key
            # give enough time to the other thread to grab the key
            print("Worker {} has the lock!".format(num))
            blink(50, 0.02, num)
            _l.release()
            time.sleep(1)

        else:
            # write code to:
            # print message for waiting for the key
            # blink for a while with a different rate
            # the timing between having the key + yield and waiting for the k
            print("Worker {} is waiting for the lock!".format(num))
            blink(25, 0.04, num)
            time.sleep(2)

    print('worker {} is done.'.format(num))

threads = []
fork = threading.Lock()
for i in range(2):
    t = threading.Thread(target=worker_t, args=(fork, i))
    threads.append(t)
    t.start()

for t in threads:
    name = t.getName()
    t.join()
    print('{} joined'.format(name))

```

```
Worker 0 has the lock!  
Worker 1 is waiting for the lock!  
Worker 0 has the lock!  
Worker 1 is waiting for the lock!  
Worker 0 has the lock!  
Worker 1 has the lock!  
Worker 0 is waiting for the lock!  
Worker 1 has the lock!  
Worker 0 has the lock!  
Worker 1 is waiting for the lock!  
Worker 0 has the lock!  
Worker 1 has the lock!  
Worker 0 is waiting for the lock!  
Worker 1 has the lock!  
Worker 0 has the lock!  
Worker 1 is waiting for the lock!  
Worker 0 has the lock!  
Worker 1 has the lock!  
Worker 0 is waiting for the lock!  
Worker 1 has the lock!  
worker 0 is done.  
Thread-6 joined  
worker 1 is done.  
Thread-7 joined
```
